The front cover picture, provided by Yewen Fang and co-workers, sheds new light on cyclopropanation. With chloromethyl silicate as a methylene transfer reagent, the alkene cyclopropanation has been accomplished by means of visible light-mediated redox-neutral catalysis.

The front cover picture, provided by Stephen Hashmi and co-workers, represents the result of their work on establishing a fundamental set of Nâ€•oxides in homogeneous oxidative gold catalysis. This basic set of Nâ€•oxides should be an integral component in each reaction optimization which allows identification of the best Nâ€•oxide in less steps.. This is illustrated in the cover picture by ...

Advanced Synthesis & Catalysis: Early View

Enzyme catalysis is the increase in the rate of a chemical reaction by the active site of a protein. The protein catalyst may be part of a multi-subunit complex, and/or may transiently or permanently associate with a Cofactor (e.g. adenosine triphosphate). Catalysis of biochemical reactions in the cell is vital due to the very low reaction rates of the uncatalysed reactions at room temperature ...

Advances in Materials (AM) publishes reviews, full-length papers, and short communications recording original research results on, or techniques for studying the relationship between structure, properties, and uses of materials. The subjects are seen from international and interdisciplinary perspectives covering areas including metals, ceramics, glasses, polymers, electrical materials ...

Synthesis & Catalysis: Open Access is a journal which publishes articles after thorough peer review process. This journal is highly useful to Chemists, medical students, and a resource for chemical process, as it clearly describes the essential scientific information on protein synthesis, Organic synthesis, Chemical synthesis, Biosynthesis, DNA synthesis, RNA synthesis, ATP synthesis, Fatty ...

Advances in Natural Sciences: Nanoscience and Nanotechnology is jointly published by IOP Publishing and the Vietnam Academy of Science and Technology (VAST). It has a dedicated international Editorial Board working with advisers.. Highlights of 2017 ANSN is proud to present its Highlights of 2017 collection. These articles, specially selected by the Editors, represent some of the best research ...

An allene is a compound in which one carbon atom has double bonds with each of its two adjacent carbon centres. Allenes are classified as polyenes with cumulated dienes. The parent compound of allene is propadiene. Compounds with an allene-type structure but with more than three carbon atoms are called cumulenes. Allenes are much more reactive than most other alkenes.
